This is a very basic One-Pager app that you have to build. Pay special attention to UI, Animation & App-Responsiveness. Code/Architecture is not important. The task should generally take 60-90 minutes.

1. List of Simple Text Based Posts(Simple text views would do).

2. On Tapping a Post, a popUp opens with the list of comments(Comments can also be simple textviews)

3. Ability to be able to hold & smooth scroll this popup outside the visible window (Just like it happens on FacebookApp). The view should be draggable vertically (in **upward** & **downward** directions).

Once you are done, please email the code to tanshul@healofy.com Also, Mention important details you would like to add related to your code. Please share the APK as well .

Note: Please note that you have to implement it yourself. Use of 3rd party library or BottomSheet is not recommended for the scroll behaviour.
